Welcome to the Program,

It began with the purchase of two Angus heifers in 1932 from Henry Shroeder in Lorraine and has evolved into a 350 mother cow herd. Beginning with calving ease, carcass composition, feed efficiency and cost of production, we have been using the technology available in the industry to select for the best complete cow herd.

Our goal is to provide you with problem free seedstock that will give you the most profit. Not every bull fits every program, so we strive to give you the most information possible for you to make your selection. Please feel free to contact us if you have any questions.

We would like to invite you to join us Monday, April 3, 2023 at 1pm for our 64th Annual Production Sale. The bulls can be viewed at the sale site the weekend before the sale.

Please join us for a family style dinner Sunday evening April 2, at the sale barn, with special guest speaker John Stika, President of Certified Angus Beef®. Food and drink will be available starting at 6:30, everyone is invited to come whenever they can get there.

If you have any questions or if we can do anything to make your stay more comfortable, please give us a call at 785-472-3752.

viewing at the Sale Barn

6:30pm
Dinner at Sale Barn with
guest speaker
John Stika

Monday April 4th

8:30am Coffee and Pastries

9:30am Registration Opens

11:30 am Lunch hosted by
Smoky Hill Cattlewomen

1:00 pm Sale Starts

A Heifer Pick of the Herd

We will be kicking off our 64th Annual Production Sale with a 'Pick' from our fall bred or spring open heifers.

This is an outstanding set of heifers to choose from, including three flush mates to Lots 67 and 68. The fall bred heifers scanned an average IMF of 8.24 with backfat of .28, the entire group averaged in the top 2% for Marb, 3% for \$G, 15% for \$C and 20% for CED and \$EN.

There will be 52 fall bred heifers and 51 spring open heifers to choose from.

The heifer will sell in her entirety with no reservations. The pick must be made by April 24th.

Highlighting some of our favorites you can 'Pick' from

In 1989, Jon Brethour, meat animal scientist at KSU Hays Beef Research Center, started scanning our calves at 6, 12 and 18 months of age to help develop his ultrasound technology. Starting us off on 34 years of using ultrasound technology to produce animals that reduce days on feed, have less outside fat while meeting and exceeding CAB qualifications.

The Targeting the Brand™ logo is designed to highlight registered Angus bulls with greater genetic potential to produce calves meeting the most challenging specifications of the Certified Angus Beef® brand. Bulls must meet genetic requirements of +0.65 Marbling EPD and +55 Dollar Grid (\$G) to qualify for use of the Targeting the Brand™ logo.

The 110 Bulls selling
in our
2023 Production Sale
Average +1.55 on Marbling EPD
and +92 Dollar Grid (\$G)

GrowSafe at Green Garden

For forty plus years we have been identifying our most efficient cows by comparing cows weight in relation to the calves weaning weights. In 2004 the American Angus Association introduced \$Values, giving us another selection tool to help identify our efficient cows, and also validate what we have done so far.

In 2010, we took a challenge from Dr. Craig Hayes to see how well our Calving Ease and High Marbling genetics would do in a feedlot testing facility. The perception has been that high growth cattle are very efficient in a feedlot sitting, but when you add high marbling, calving ease genetics to the mix, their feed efficiency goes down.

Then came the opportunity to get actual individual feed test data at the Hayes Beef Development Center in Iowa. The results were very surprising. Our first sets of bulls to go through the test station showed what a huge difference in feed intake we had within our herd. In the chart below we compare two of the bulls that had the exact same average daily gain of 4.73. Though they gained the same amount of weight on test, bull A ate 942 pounds less feed.

Tag	Reg #	Sire	ADG	DMI	RFI	F:G	IMF Ratio
Bull A	16962695	Gardens Star Time	4.73	14.2	-7.51	3.04	114
Bull B	16904773	ISU Imaging Q 3011	4.73	30.3	4.40	5.77	83

Bull A consumed 14.2 lbs of feed a day while Bull B consumed 30.3 lbs. For every pound of gain, Bull A consumed 3.04 lbs of feed, and Bull B consumed 5.77 lbs of feed. The difference of the feed costs between those two animals is notable. This lead to two more years of testing at the Hayes Center, before we decided to invest in our own GrowSafe system, allowing us to not only test our bulls, but also all of our females. The last set of females on test did a remarkable job, as their pen ADG was 5.85 with an average DMI of 17.5 and an average F:G of 3.09 with an average IMF score of 7.29, with an average back fat .28.

RFI is a measure of the amount of feed consumed above or below the average feed to gain of the contemporary group, which is 0. Going back to our example, Bull A had an RFI of -7.51, well below the average of the contemporary group of 0, while Bull B had an RFI of 4.40 well above the pen average of 0.

We are combining Feed Efficiency with High Carcass Quality to make animals that finish with less days on feed and eat less pounds of feed per day.

With the use of actual cow weights/calf weaning weights, \$EN, RADG EPD, DMI EPD and DNA, and feed test data we are advancing towards our goal of creating problem free seedstock that will make you the most profit.

In this ever changing world, one thing to remember is, the lower your feed to gain the lower the carbon footprint for your cattle.

Predictable Genetics from Start to Finish

Calving Ease

In 1983, Green Garden began a program of stacking pedigrees to create a calving ease product, using the 18th century concept of breeding “like begets like”. We used herd sires that were stacked several generations deep in low birthweight EPDs and bred them to cows with similar genetic makeup that also had production histories of low actual birthweights. The results have been dramatic on our farm and with our customers. Calving difficulty has almost been eliminated with the exception of an occasional abnormal presentation. Heifers that were checked twice daily are now treated as we do the cows. They are checked once a day and calve out in open pastures. Having a live calf is the first step, the second step we strive for is keeping expenses to a minimum.

The Cost of Production - \$EN

Since 1974, we have been monitoring our cow weight in relationship to her calf's weaning weight to select for the most efficient mother cow. The \$Values now available from the American Angus Association are a resource that help us in our selection process. In 2013, we installed a GrowSafe System, which also allows us to test our yearling bulls and females for individual feed intake and growth information. Our goal is to identify cattle that will genuinely bend the growth curve, calve easily, grow rapidly to market weight and hang a superior product on the rail.

The DNA Difference

In 2003, we were introduced to a new program called Gene Star to test DNA for the most important genetic traits. We started out sampling our herd sires and some of our foundation cows for the first three DNA markers for marbling. Since then, DNA testing has expanded to Zoetis HD50K and AngusGS profiles which we use on all of our young cattle to aide in the selection process. This testing also goes into the American Angus Association's Genomic enhanced EPDs which helps increase the accuracy of the EPDs we provide to our customers. At the bottom of each lot you will see each animals DNA percentage profile.

The Finished Product

Deciding that it doesn't cost any more to produce a superior carcass than one of a lesser grade, in 1989, we took the same concepts we used for calving ease and put it toward improving carcass merit. John Brethour, the meat animal research scientist at the KSU Beef Research Center in Hays, Kansas, selected our herd when he was developing his ultrasound technology. For several years, he scanned our calves at six months, at a year and again at 18 months of age. We were excited to have been part of this program, and have benefited greatly from the data generated. Using ultrasound data as well as DNA markers, we hope to create seedstock that will help our customers produce animals that reduce days on feed with less outside fat while producing a product that meets CAB® qualifications or better.

Come join us April 3!

American Angus Association \$Value Indexes

Maternal Weaned Calf Value (\$M), an index expressed in dollars per head, predicts profitability differences in progeny due to genetics from conception to weaning. \$M is built off of a self-replacing herd model where commercial cattlemen replace 20% of their breeding females in the first generation and 20% in subsequent generations. Remaining cull females and all male progeny are sold as feeder calves. Increased selection pressure on \$M aims to decrease overall mature cow size and improve foot structure and fertility while maintaining weaning weights consistent with today's production.

Weaned Calf Value (\$W), an index expressed in dollars per head, provides the expected difference in future progeny preweaning performance from birth to weaning. \$W assumes that producers retain 20% of their female progeny for replacements and sell the rest of their cull female and male progeny as feeder calves. Over time, increased selection pressure on \$W will increase pre-weaning growth through additional weaning weight and maternal milk with expenses adjustment for mature size and maternal milk.

Feedlot Value (\$F), an index expressed in dollars per head, is the expected average difference in future progeny performance for postweaning merit compared to progeny of other sires. The underlying objective assumes commercial producers will retain ownership of cattle through the feedlot phase and sell fed cattle on a carcass weight basis with no considerations of premiums or discounts for quality and yield grade.

Grid Value (\$G), an index expressed in dollars per carcass, is the expected average difference in future progeny performance for carcass grid merit, including quality and yield grade attributes, compared to progeny of other sires.

Beef Value (\$B), an index expressed in dollars per carcass, facilitates simultaneous multi-trait genetic selection for feedlot and carcass merit. \$B represents the expected average difference in the progeny post-weaning performance and carcass value compared to progeny of other sires. This index assumes commercial producers wean all male and female progeny, retain ownership of these animals through the feedlot phase and market these animals on a quality-based carcass grid.

Combined Value (\$C), an index expressed in dollars per head, includes all traits that make up both \$M and \$B with the objective that commercial producers will replace 20% of their breeding females per year with replacement heifers retained within their own herd. The remaining cull heifer and steer progeny are then assumed to be sent to the feedlot where the producers retain ownership of those cattle and eventually sell them on a quality-based carcass merit grid.
